                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score

PATHWAY: GPI-anchor biosynthesis.
SUBUNIT: Associates with PIGS and PIGT.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY C13.
                                                                                                                                                                                                                                                                                                                  Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

FUNCTION: Mediates GPI anchoring in the endoplasmic reticulum, replacing a protein's C-terminal GPI attachment signal peptide with a pre-assembled GPI. During this transamidation reaction, GPI transamidase forms a carbonyl intermediate with the substra
                                                                                                 605087;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MISCELLANEOUS: A 70 amino acid island between the 20th and the 21th LRR is essential for the binding of brassinosteroids.

MISCELLANEOUS: Binding of brassinosteroid induces intramolecular autophosphorylation of BRII. Interaction with BAKI activates both receptor kinases and the full activation of either receptor kinases and the full activation of either receptor kinase requires transphosphorylation by their partners. Optimum in vitro phosphorylation of the substrate requires arg or Lys residues at P-3, P-4, and P+5 (relative to the phosphorylated amino acid at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARITY:

RA Lecouter J.E., Whyte P.F.M., Rudnicki M.A.;

RT "Cloning and expression of the Rb-related mouse pl30 mRNA.";

CC "I- FUNCTION: MAY HAVE A FUNCTION IN CELL CYCLE REGULATION. BINDS TO CC AND MAY BE INVOLVED IN THE TRANSFORMING CAPACITY OF THE ADENOVIRUS CC E1A PROTEIN. MAY ACT AS A TUMOR SUPPRESSOR. POTENT INHIBITOR OF CC E2F-MEDIATED TRANS-ACTIVATION, ASSOCIATES. PREFERENTIALLY WITH CC E2F-MEDIATED TRANS-CATIVATION, ASSOCIATES. PREFERENTIALLY WITH CC E2F5. BINDS TO CYCLINS A AND E (BY SIMILARITY).

CC -I- SUBCELLULAR LOCATION: Nuclear.

CC -I- PTM: Phosphorylation on Ser-669 in G1 leads to its ubiquitin-

Ammendent proteolysis (By similarity).

 The present sequence represents the VH component of a modified human of scFv antibody which has specific affinity for a characteristic epitope of the ED-B domain of fibronectin. The affinity of the antibody for this epitope was improved by introducing a number of mutations in the complementarity determining region (CDR) residues located at the periphery of the binding site. The improved antibody is used for rapid targeting markers of angiogenesis, for detecting diseases characterized by vascular proliferation, such as diabetic retinopathy, age-related by vascular proliferation or tumours. The antibody localizes the respective constant of the first and diseases characterized by the first and diseases characterized by the respective constant of the preparation of diseases characterized by vascular proliferation. The antibody can be conjugated to a molecule which induces blood coagulation and blood vessel occlusion. These conjugates are used in the preparation of injectable compositions for the treatment of angiogenesis-related pathologies, especially caused by or associated

 The invention relates to an antibody with specific affinity for a characteristic epitope of the ED-B domain of fibronectin, where the antibody has improved affinity to ED-B. The invention also relates to conjugates comprising antibodies with a suitable photoactive molecule useful in the detection and/or coagulation of blood vessels. An antibody with improved affinity to the ED-B domain is useful for diagnosis and therapy of tumours and diseases characterised by vascular proliferation, cancer, rheumatoid arthritis, neo-vasculature associated ocular comprises the injection of conjugates comprising antibody and a molecule capable of inducing blood coagulation and blood vessel occlusion. The present sequence is single-chain variable antibody fragment (scFV) L19 antibody variable heavy chain (VH) region related to the invention.

The present invention describes a method for detecting the presence of fibronectin isoform B (B-FN) in body fluid of an individual. The method convolves passing the fluid over a solid support (SS) to which gelatin that binds FN is attached, such that if FN is present, it is retained on SS by binding gelatin, and determining the presence of B-FN on SS by comparison of B-FN is a stratched, such that if FN is present, it is retained on SS by binding the ability of a specific binding member for extra domain B comparison of B-FN in a body fluid taken or collected quantitative determination of B-FN in a body fluid taken or collected from an individual. Other methods from the present invention can be used: from an individual. Other methods from the present invention can be used: for quantitating the amount of an insoluble marker protein in a sample cof tissue or tumour; for determining the grade or severity of neoplasia in a sample of tissue or tumour. An elevated level of B-FN in a body comparison in the clinic present in diagnostic and prognostic situations. The methods are useful in diagnostic and prognostic situations. The methods can be readily applied to small biopsy samples constant in the clinic, thereby providing valuable information without componing to the patients or complications for the Clinic binding antibody molecule, which is used in the exemplification of a B-FN ED-B clinic binding antibody molecule, which is used in the exemplification

 Screening antibody; 2-D electrophoresis; antibody library; proteomics.
 The invention relates to screening an antibody against a specific protein in an objective structure sample containing a protein group in high efficiency, comprising reacting an objective structure sample containing a protein group or a portion containing an objective protein in the sample with an antibody library, recovering the antibody combined with the protein, replicating the recovered antibody and reacting it with the objective protein at least once. The method is used for the identification of an objective protein. The present sequence is an antibody chain (derived from the DP47 heavy chain, the DPK22 light chain) used in the method of the invention.

 The invention relates to a novel method for screening an antibody, comprising performing 2-D electrophoresis on plural proteins in a sample. Individual protein spots are separated by reacting them with an antibody library and then replicating the bound antibodies before reacting them with the spot proteins again. The method is useful for screening an antibody specific for a target protein, e.g. from a phage antibody library, which is useful in proteomics for studying various protein and complementary deoxyribonucleic acid (cDNA) expression libraries as well as gene functions, and in other biological and medical sciences. This sequence is a protein relating to the antibody screening method of the

 The invention relates to an antibody to human CD40, or its functional fragment, has at least one of the following properties: acting on dendritic cells to produce II-12 in the presence of LPS (lipopolysaccharide) and IrNgamma (interferon gamma); acting on dendritic cells to activate maturity of the dendritic cells with high G28-5 antibody; and activating CD95 expression with high G28-5 antibody against B cell line. Such antibodies or functional fragments can be used as immunoactivators, anti-tumour agents, immunosuppressants, and as remedies for autoimmune diseases, allergy or coagulation factor VIII inhibitors

 The invention relates to a novel purified preparation of a human CC antibody, which binds to a tissue inhibitor of metalloprotease-1 (TIMP-1) cc and neutralises a matrix metalloprotease (MMP)-inhibiting activity of TMP-1. The antibody comprises a variable heavy chain (VMC)DR3 region and CC a variable light chain (VLC)DR3 region. An antibody preparation of the CC invention has hepatotropic, cytostatic, nephrotropic and cardiant CC invention has hepatotropic, cytostatic, nephrotropic and cardiant CC activity. The human antibody is useful for decreasing an MMP-inhibiting CC symptoms of a disorder in which TIMP-1 is eleverated, e.g. liver CC symptoms of a disorder in which TIMP-1 is elevated, e.g. liver CC syndrome, lupus nephritis, glomerulosclerotic renal disease, idiopathic CC uncer. The antibody is also useful for detecting a TIMP-1 in a test C preparation, or in diagnosing a disorder in which a TIMP-1 level is clevated. The sequences shown in ABRO1502-ABRO1545 represent the heavy can contain regions of a human anti-TIMP-1 antibody of the invention.

"Amino acid sequence of the Fv region of a human monoclonal IgM
(protein WEA) with antibody activity against 3,4-pyruvylated
galactose in Klebsiella polysaccharides K30 and K33.";

Proc. Natl. Acad. Sci. U.S.A. 80:4837-4841(1983)

-1- MISCELANEOUS: THIS CHAIN WAS OBTAINED FROM A MONOCLONAL ANTIBODY
AGAINST 3,4-PYRUVYLATED GALACTOSE AND ISOLATED FROM A PATIENT WITH
WALDENSTROM'S MACROGLOBULINEMIA.

-1- SIMILARITY: Contains 1 immunoglobulin-like domain.

 CONFLICT
 -I-TISSUE SPECIFICITY: Widely expressed. Expressed in brain, testis, lung, spleen and kidney. Weakly expressed in liver.
-I-DEVELOPMENTAL STAGE: Expressed in the unfertilized egg, in the blastocyst, as well as in the developing embryo and fetus.
-I-DISEASE: Defects in RALY are the cause of lethal yellow mutation (A(y)), a dominant allele that cause embryonic lethality when homozygous, and pleiotropic effects when heterozygous, including yellow pelage, obesity, non-insulin dependent diabetes and increased tumor susceptibility. A(y) is due to a 170 kb deletion RALY and links them to the ASIP/Agouti gene.
-I-SIMILARITY: Contains I RNA recognition mottif (RRM) domain.

 Andrew D., Nathans J., Nusse R.;
"A new member of the frizzled family from Drosophila functions as
 FUNCTION: Receptor for Wnt proteins. Most of frizzled receptors are coupled to the beta-catenin canonical signaling pathway, which leads to the activation of dishevelled proteins, inhibition of GSK-3 kinase, nuclear accumulation of beta-catenin and activation of Wnt target genes. A second signaling pathway involving PKC and calcium fluxes has been seen for some family members, but it is not yet clear if it represents a distinct pathway or if it can be integrated in the canonical pathway, as PKC seems to be required for Wnt-mediated inactivation of GSK-3 kinase. Both pathways seem to be required to the canonical pathway, as PKC seems to be required to wnt-mediated inactivation of GSK-3 kinase. Both pathways seem to be required to the canonical pathway as PKC seems to be required to wnt-mediated inactivation of GSK-3 kinase. Both pathways seem to be required to wnt-mediated inactivation of GSK-3 kinase.
 to involve interactions with G-proteins. Required the cytoskeletons of epidermal cells to produce a of cuticular hairs and bristles.

 -!- SIMILARITY: Contains 1 frizzled (FZ)
 SIMILARITY: BELONGS
 DOMAIN: The fz
 between 15 and 70 per cent of egg length, including the invaginating cells of the ventral furrow. Stripe pattern is emerging by early stage 8. From stage 9 and continuing throughout embryogenesis, expression is seen in the developing CNS. At stage 10, expressed in 15 stripes in the presumptive head and trunk regions, in the posterior midgut primordium, in a subset of cells of anterior midgut invagination and in the procephalic lobe. At stage 12, expression declines in epidermis and increases in the midgut and visceral mesoderm. At stage 17, only expressed in the CNS, hindgut and dorsal vessel.
 DOMAIN:
 the Wnt/beta-catenin signaling pathway (By similarity). DOMAIN: The fz domain is involved in binding with Wnt ligands.
 DEVELOPMENTAL STAGE: Expression starts at stage 6 in
